

Seminar - MUD in pipes, eccentric orbits and interesting facts, by Roberto Flores

This work is not focused on the theoretical content of the presentation but on the speaker's communicative skills. The presentation analyzed is the seminar held on December 21 by Roberto Flores which was about MUD in pipes, eccentric orbits and interesting facts. However there was not enough time so he finally only talked about MUD in pipes.

As to his oratory, comment that he was very slow and he made many pauses to think, so it was hard to keep the attention. During the presentation he sighed repeatedly, which makes me think that he did not have much interest either. I also think it is important to mention that his phone rang a couple of times interrupting his own speech, this could have been avoided by silencing it from the beginning.

Throughout the presentation he has touched the screen several times, as it is not rigid it begins to ripple and makes reading difficult.

On the other hand, the slides contained too much text. This generates that as listener you can not attend to him and read the information at the same time, this hinders the understanding. The graphics presented were also difficult to understand as the titles and scales were too small.

In his favor I had to said that he was not lost, he was well acquainted with the subject on which he spoke and set good examples making more interesting the topic. His tone of voice was good and he used his body to speak attracting the attention of those present in the room. He also took into account the type of audience he was addressing because he used a language appropriate to the public and made a couple of jokes looking closer.

To end this critical review, I should say that the public was not good at all. Many people arrived late and making a lot of noise, and there were also people who had not paid attention at all as they were talking and commenting on other topics
